

idius, (3) *Dicrurus modestus atactus*, (4) *Fraseria prosphora*. Two new genera, *Horizocerus* and *Stelgidillas*, are also characterized, and a specimen of the rare Hawk, *Dryotriorchis spectabilis* is reported, the ninth specimen of this species thus far known.—J. A. A.

New Birds from the Bahamas.—Mr. C. J. Maynard, in an 'Appendix to Catalogue of the Birds of the West Indies' (which Catalogue we have not yet seen) has published (Nov. 29, 1899) descriptions of four new species of birds from the Bahamas, namely; (1) *Colinus bahamensis*, from the island of New Providence; (2) *Speotyto bahamensis*, from "New Providence and probably Eleuthera"; (3) *Dendroica bahamensis* ("similar to *Dendroica vigorsii*"), from New Providence; (4) *Hamotopus* (sic) *pratii* (provisional name), from Flemming's Key.—J. A. A.

Kopman on the Bird Fauna of Two Sections of Louisiana.¹—This paper gives a comparison of the representation of 67 species in contiguous but very different portions of southern Louisiana, the fertile alluvial coast district and the pine barrens to the northward. These two areas are separated by the chain of lakes formed by Lake Maurepas, Pontchartrain and Borgne, and mark an abrupt transition from the alluvial fertile district, with its deciduous arboreal vegetation, to the pine districts, or 'pine barrens,' which extend from the eastern border of Louisiana into Mississippi. While scarcely a dozen species are restricted to either of these areas, the relative number of individuals of birds which are common to both varies so greatly as to form a strong contrast in the general ornithological character of the two regions, obviously due to the difference in vegetation and coincident conditions of environment. The birds listed for comparison are mainly the commoner summer residents.—J. A. A.

Faxon and Hoffmann's Birds of Berkshire County, Mass.²—Berkshire County, Massachusetts, differs so much from the rest of the State in altitude and other physical conditions as to form a well-marked region, and one, moreover, until recently ornithologically very imperfectly known. With a general altitude of 1500 to 2000 feet, and with peaks rising from 2400 to 3500 feet, the general character of the fauna and flora is distinctly more boreal than that of that portion of the State to the eastward. For many years ornithologists were left to conjecture as to the birds frequenting the higher parts of 'The Berkshires.' As early as 1884, however, definite
